Radial insert ball bearings

Features

INA radial insert ball bearings are robust, ready-to-fit rolling bearings for the design of particularly economical bearing mounts. These robust machine elements are available in numerous designs that differ essentially in the outside surface of the outer ring, the method of location on the shaft and the sealing arrangement.

The classic areas of application for these bearings include the agricultural, construction and mining sector, conveying equipment, textile, paper and woodworking machinery as well as machines for the filling, timber and packaging industries.

Radial insert ball bearings comprise solid outer rings, inner rings extended on one or both sides, cages made from plastic or sheet steel and contact seals on both sides. Bearings with an inner ring extended on both sides undergo less tilting of the inner ring and therefore run more smoothly.

Inner rings and locking collars are plated with Corrotect®. For information on Corrotect®, see page 4.

Compensation of misalignment

The outer ring has a spherical or cylindrical outside surface.

In conjunction with an INA housing with a concave bore matched to the bearing design, bearings with a spherical outer ring can compensate static misalignments of the shaft, see Compensation of misalignments, page 10.

Location on the shaft

Radial insert ball bearings are located on the shaft by means of an eccentric locking collar or two set screws in the inner ring.

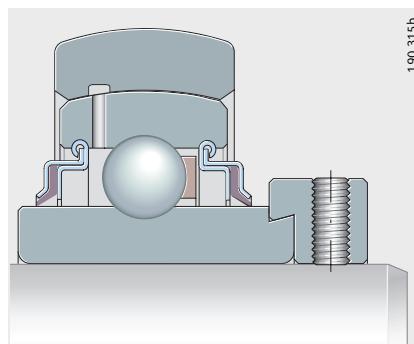

Radial insert ball bearings with eccentric locking collar

These "classic" INA radial insert ball bearings are located on the shaft by means of a locking collar, *Figure 1*. They are particularly suitable for bearing mounts with a constant direction of rotation or, under low speed and load, for an alternating direction of rotation.

The locking collar is preferably tightened in the direction of rotation and secured by means of a set screw. This location method prevents damage to the shaft and can be easily loosened again.

G..-KRR-B-AS2/V

Figure 1
Location using
eccentric locking collar

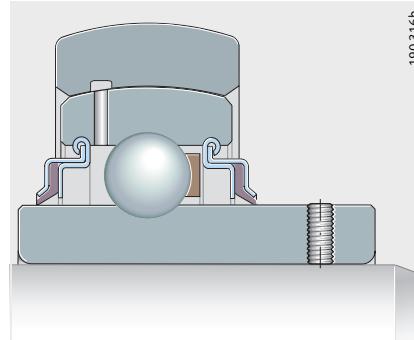

Radial insert ball bearings with set screws in the inner ring

In these radial insert ball bearings, the inner ring is located on the shaft by means of two set screws offset by 120°, *Figure 2*. This location method is suitable for bearing mounts with a constant direction of rotation or, under low speed and load, for an alternating direction of rotation.

The set screws are self-locking and have a fine-pitch thread with cup point for secure location of the bearings on the shaft.

GY..-KRR-B-AS2/V

Figure 2
Location using
set screws in the inner ring

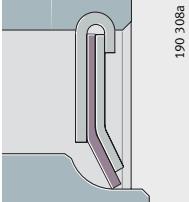

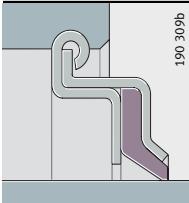

Sealing/lubrication

The bearings are sealed on both sides by means of P or R type seals, see table Seal types.

P and R type seals are of a three-piece design. This concept ensures, due to the rigidly rolled-in sheet steel washer, optimum seating in the bearing as well as concentric alignment of the seal lip to the inner ring. In conjunction with the seal type and the sealing ring material, the bearings are thus reliable in operation even under difficult environmental conditions.

Radial insert ball bearings are greased and can be relubricated.

Seal types

P seal
 Two zinc-plated sheet steel washers with intermediate NBR part, seal lip axially preloaded. In order to protect the seal lip from mechanical damage, the outer sheet steel washer extends a considerable distance down towards the bearing inner ring. Used in narrow radial insert ball bearings with inner ring extended on one side.
R seal
 Two zinc-plated sheet steel washers extended outwards and angled downwards with intermediate NBR part and radially preloaded seal lip. Better protection against mechanical damage. Substantial grease reservoir due to the space between the extended and angled sheet steel washers. Used in radial insert ball bearings with inner ring extended on both sides.

Radial insert ball bearings

Corrotect® plating

The special INA plating Corrotect® is an economical alternative to traditional forms of corrosion protection for radial insert ball bearings.

Advantages of the Corrotect® plating

- All-round anti-corrosion protection – even on machined surfaces on chamfers and radii
- Long-term prevention of rust penetration beneath seals
- Small bright spots are protected against corrosion by the cathodic protection mechanism
- Anti-corrosion protection allows a significantly longer operating life compared to unplated parts
- Uncoated bearings and housings are fully interchangeable with the coated versions of the same design
- Bearings and housings made from corrosion-resistant rolling bearing steel are often no longer required.

Corrosion-resistant radial insert ball bearings are suitable where moisture, contaminated water, salt spray mist or weakly alkaline and weakly acidic cleaning agents are present.

For further information on Corrotect®, see also the section Anti-corrosion protection, catalog Rolling Bearings, HR1.

Speed limits for radial insert ball bearings – guide values

The speed limits are dependent on the load, the clearance between the bearing bore and shaft and the friction of the seals in bearings with contact seals.

Figure 3 gives guide values for the permissible speeds.
In the case of load ratios $C_r/P > 13$, the speeds can be increased.
For these applications, please contact us.

If $C_r/P < 5$, location by means of interference fit is recommended.

Tightening torques for set screws

Hex key size	Thread	Tightening torque ¹⁾ Nm
$\frac{3}{32}$	10 - 32 UNF	3,6
$\frac{1}{8}$	$\frac{1}{4}$ -28 UNF	6
$\frac{5}{32}$	$\frac{5}{16}$ -24 UNF	14
$\frac{3}{16}$	$\frac{3}{8}$ -24 UNF	26
$\frac{1}{4}$	$\frac{1}{2}$ -20 UNF	42

¹⁾ The tightening torques are valid for original INA set screws only.

Example of permissible speed calculation

Given:

Shaft tolerance h6

Radial insert ball bearing GRA104-NPP-B-AS2/V

Basic dynamic load rating C_r 19 500 N

Load P 1300 N

Sealing P seals.

Required:

Load ratio

$$C_r/P = 19\,500 \text{ N} / 1300 \text{ N}$$

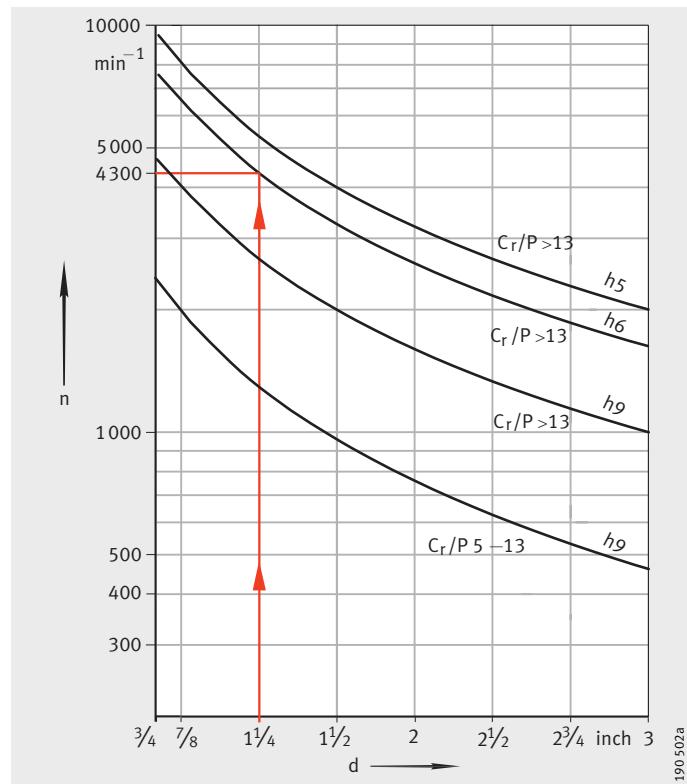

$$C_r/P > 13$$

Permissible speed

$$n \approx 4\,300 \text{ min}^{-1}, \text{Figure 3.}$$

d = bearing bore diameter
 n = permissible speed

Figure 3
 Permissible speeds for
 radial insert ball bearings

Shaft tolerances for radial insert ball bearings – recommendations

Rolling Bearing Catalog HR1

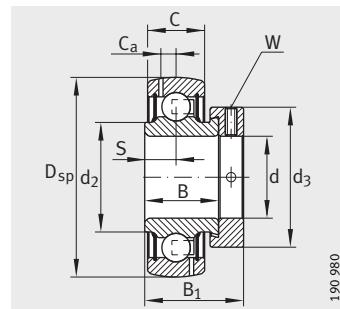

Caution!

The permissible shaft tolerance is dependent on the speed and load. Tolerances from h6 to h9 are possible. Conventional drawn shafts will suffice for most applications.

The complete standard range of radial insert ball bearings is described in comprehensive detail in the Rolling Bearing Catalog HR1.

This catalog must be taken as the basis for design of bearing mounts.

Housing units

Features

INA housing units are available as pillow block and flanged housing units in numerous different designs.

The units are ready-to-fit and comprise INA cast iron housings with a concave bore in which INA radial insert ball bearings are fitted. In order to ensure function and reliability under all operating conditions, the bearings and housings are matched to each other.

Due to the wide range of housing designs, the right solution can be found for any specific application. The areas of application of the units correspond to those of the insert bearings.

Due to the spherical outside surface of the bearing outer ring and the concave housing bore, housing units can compensate for static angular misalignment of the shaft; see Compensation of misalignments, *Figure 1*.

The units are used predominantly as locating bearings, but are also suitable as non-locating bearings under low loads and speeds.

Bolts are used to fasten the housings to the mounting surfaces. Less stringent tolerances are adequate for the bolts mounting surfaces; see Design of adjacent construction, page 12.

Compensation of misalignments

Units with a spherical outer ring and concave housing bore can compensate for static misalignment of the shaft, *Figure 1*:

- if relubrication is used, up to $\pm 2.5^\circ$
- if relubrication is not used, up to $\pm 5^\circ$

Caution!

These units are not suitable for dynamic misalignment; continuous swiveling or tumbling of the bearing within the housing will cause premature failure.

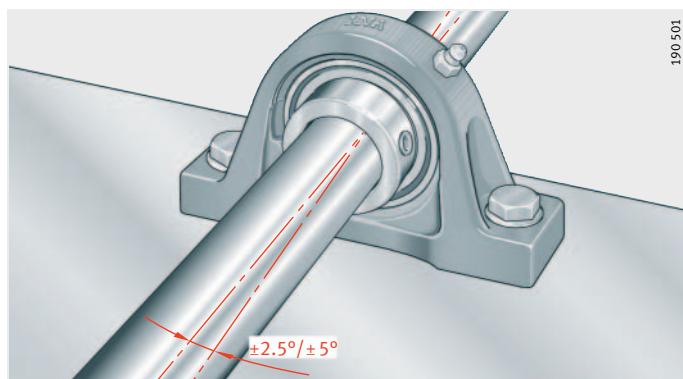

Figure 1
Compensation of
static shaft misalignment

Housing units with cast iron housing

Cast iron housings are single-piece units with high load carrying capacity; see Load carrying capacity of housings, page 12.

For relubrication of the radial insert ball bearings, the housing bore has a lubrication groove and the housing has a lubrication hole for conventional lubrication nipples.

Cast iron units are available as pillow block and flanged housing units, *Figure 2* and *Figure 3*.

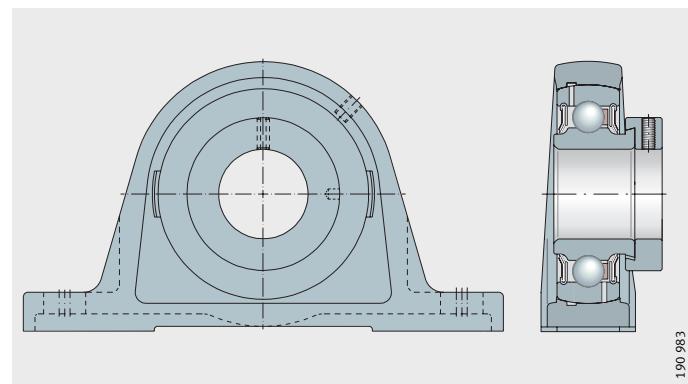

Housing materials

The material used for the cast iron housings is cast iron to ASTM A48 Class 30.

Housing units

Load carrying capacity of housings

Caution!

Due to their versatile characteristics, INA housings can be used without difficulty in almost all industrial sectors.

If bearing mounts are planned for equipment in which a malfunction could be hazardous to persons or an unplanned stoppage of the machine could cause major disruption, it is essential that you consult us before proceeding with the design.

Cast iron housings – radial load carrying capacity

Cast iron housings can support the same radial loads as the radial insert ball bearings fitted. The static load carrying capacity of the radial insert ball bearings C_{0r} is stated in the dimension tables. For shock loads, appropriate safety factors must be applied. In this case, please contact us.

Axial load carrying capacity

The axial load carrying capacity of cast iron housings is restricted to $0.50 \times C_{0r}$.

Design of adjacent construction

Bolts mounting surfaces

Recommendations for the bolt mounting surfaces:

- roughness of the bolt mounting surfaces max. $R_a 12,5$ ($R_z 63$)
- geometrical and positional tolerance 0,04/100 concave, spherical not permissible.

Mounting bolts

Bolts should be grade 5 or better and washers and/or lock washers are recommended.

The bolts are not included in the delivery.

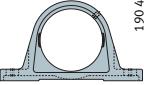

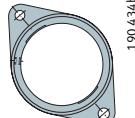

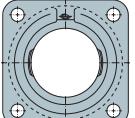

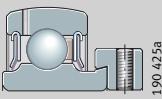

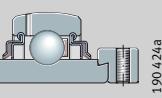

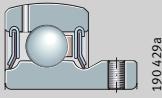

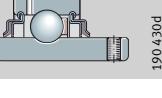

Rolling Bearing Catalog HR1

The complete standard range of radial insert ball bearings is described in comprehensive detail in the Rolling Bearing Catalog HR1.

Caution!

This catalog must be taken as the basis for the design of bearing mounts.

Other products Radial insert ball bearings

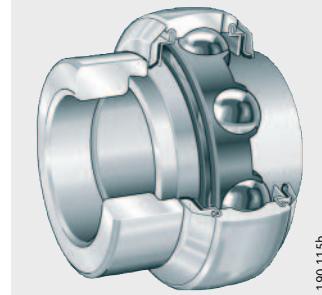

With eccentric locking collar

Spherical outer ring
Triple lip seal (KTT) or
Additional flinger shield (2C)

GE...-KTT-B

GE..-KRR-B-2C

Self-aligning deep groove ball bearings

Spherical outer ring with square or hexagonal bore

GVK..-KTT-B, VK..-KTT-B

SK..-KRR-B

Deep groove ball bearings with extended inner ring

Cylindrical outer ring

2..-KRR, 2..-KRR-AH

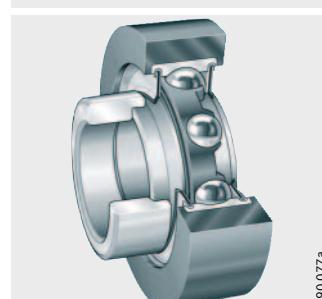

With rubber interliner

RABRA, RABRB

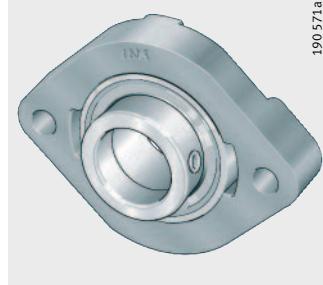

RCSMA, RCSMB

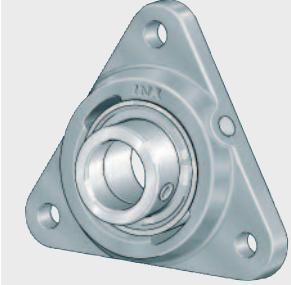

Other products Housing units

Cast iron housings

FLCTE, FLCTEY, GLCTE

PCFTR

PME, PMEY, RME, RMEY,
RMEO, TME

PSFT

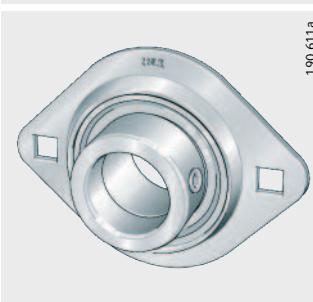

Sheet steel housings

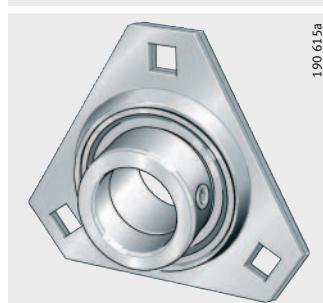

PB, PBY, RPB

RAT, RATY, RALT, PCSLT

RATR, RALTR, RRTR, RATRY

RA, RAY, RRY, GRA, GRRY

Other products

Roller chain idler sprocket units, idler pulley units

Roller chain idler sprocket units

Sprocket made from steel or
sintered iron

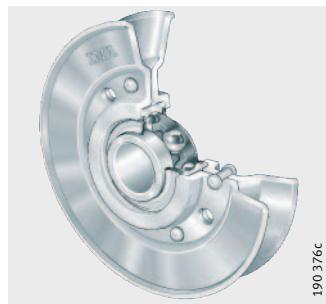

KSR..-L0

190 373c

Idler pulley units

RSRA..-L0, RSRA..-K0

190 376c
